

SQL Day 1

Client Server request and Response flow

Mobile(product_code, size, price, model,release_year,make, color)

Here Mobile is entity and its properties are product_code, size , model release_year etc

From this information ER digram will be drawn

ER Diagram

With the help of this ER diagram database is designed

-> Entity name become **Table name**

-> Entity attribute/properties will become **column name**

Mobile

| product_code | size | price | model | r_year | make | color | ram | processor |
|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|
| <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> | <input type="text"/> |

Q. What is mean by Object or Entity?

Ans: Anything in the real world is known as Object or Entity.

Examples : Mobile, Laptop, Tree,Bird, Person, Scholl,College,University.

Every object or every entity has some properties or attribute.

For Example: Mobile has properties like - size,color, wight, Brand

Q. What is Data?

Ans: Any fact related to any object is considered as Data.

For Example: Mobile has properties like - size,color, wight, Brand

Q. What is mean by Database?

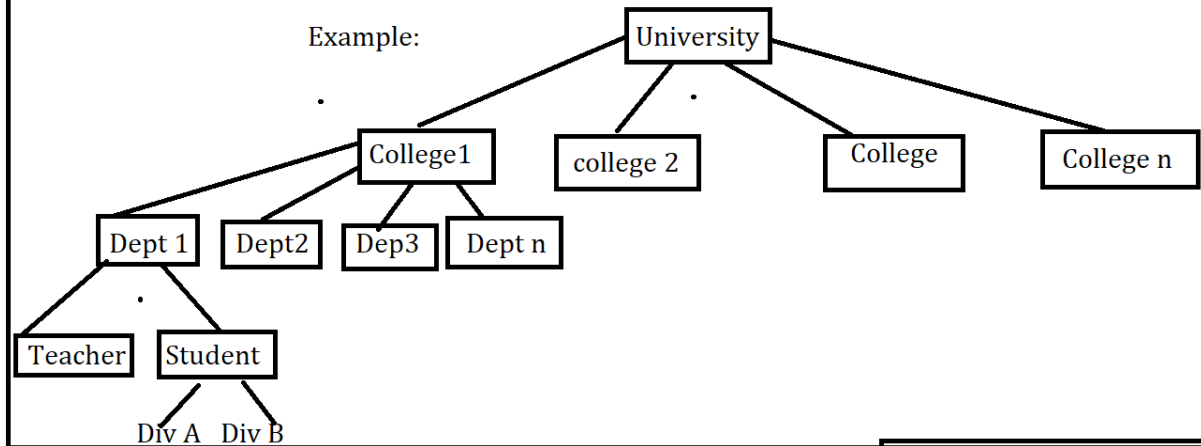

Ans: Systematic collection of data is nothing but Database

Types of Database.

1) Hierarchical Database

In this type of database there is parent and child relationship.

Example:

2) Network Database:

In this type of database, there is many to many relationship

3) Centralized Database:

In this type of Database whole data is store at single place

Example: College Central Library

4) Distributed Database

In this type of Database , same data is stored at different different location

copy1

Copy 2

Copy 3

5) No SQL Database

1) No SQL or Not only SQL

2) It store data not only in tabular form but also in other forms

Example of NoSQL is Mongo DB

```
{  
  "id": 101,  
  "name": Abc,  
  "percentage": 65.65  
}
```

```
{  
  "id": 101,  
  "name": Abc,  
  "percentage": 65.65  
}
```

5) Object Oriented Database:

In this type of Database, data is stored in the form of object

Example: PostgreSQL

6) Relational Database

- 1) It is most popular and most widely used type of database.
- 2) In this type of database, data is stored in the table
- 3) It is based on **Relational Model** which is introduced by E.F Codd

Structure of table:

- 1) Every table must have name
- 2) Every table must have at least one column
- 3) Vertical lines are called column
- 4) Horizontal lines are called rows or records

Student

| RollNo | Name | Mark | City |
|--------|------|------|------|
| | | | |
| | | | |
| | | | |

Records or rows

column

Interview Question on this topic

- 1) Is it possible to have table without name?
- 2) What are different types of Databases?
- 3) Is it possible to have table without column?
